All Hay	50-51
Potatoes	52
Flaxseed	53
Apples and Pears for fresh consumption.	54
Seeds - alfalfa, red clover and alsike clover . . .	55

INTRODUCTION

This bulletin contains two sections. The first presents a series of index numbers of prices received by Oregon farmers. The second section presents the monthly average prices on which the indexes are based.

PRICE INDEX

The first section presents the index numbers by months and the simple average of the 12 months (January to December) for the years 1910 to 1953. Since prices received by farmers seldom fluctuate in unison it is difficult to evaluate their broader movements without some kind of composite measure. This is the function served by a price index. This index expresses the average change in prices of farm products or groups of products relative to their 1910-14 average. The indexes give each commodity in the group a weight proportional to the amount of that product marketed by Oregon farmers during the weight-base periods, --1924-29 for the period prior to May 1934, and 1937-41 since that date.

MONTHLY PRICES

The second section presents the estimated monthly average prices received by Oregon farmers. The monthly prices in general reflect averages on or about the 15th of the month throughout the series. Average prices estimated by the Crop Reporting Service represent the average price received by all farmers in Oregon at the point of first sale out of farmers' hands and are averages based on all methods of sale of all grades, varieties and sizes. The most important uses of these price estimates are: (1) to provide a basis for computing index numbers which show comparative changes in prices of individual crops or groups of commodities, (2) to provide current prices which

can be combined with production and sales estimates to compute cash and gross farm income, and (3) a contribution in establishing national prices and parity ratios.

The season average prices are monthly prices weighted by the volume of each commodity sold monthly during the marketing season. However for some commodities prices are collected annually instead of monthly. Although these season average prices are also used in constructing the index, they have not been shown in this publication as they are available in the bulletin "Oregon Farm Price Data" published jointly by the Oregon State College Extension Service and the Crop Reporting Service. The two publications present all of the official farm price data available for Oregon.

ACKNOWLEDGMENT

Prices in this publication have been derived from figures furnished currently by voluntary price reporters since 1909. Much credit is due reporters who have served regularly for many years without pay. Without their help many services of the government now taken for granted would be impossible.

This bulletin was outlined and the computations started by Charles F. Leatherman, Agricultural Statistician, prior to his resignation from the Service. Florence E. Moore, Statistician, revised the Oregon index and assembled and arranged the material for publication.

PART I

INDEX NUMBERS OF OREGON FARM PRODUCT PRICES

Meaning of the Index

The index of farm product prices is a measure of the level and trend of prices received by Oregon farmers for agricultural commodities sold. The Oregon Index is constructed on the same basis as the revised U. S. Index of Prices Received by Farmers, published in January 1950 by the Bureau of Agricultural Economics ^{1/}. This makes possible a ready comparison of the level and trend of Oregon farm product prices with those for the entire country.

In general, the commodity group index combines the prices of individual farm products into a single figure which compares prices for any month or year with the prices during the period 1910-1914, referred to as the base period. A series of index numbers shows the trend of prices received by farmers for the months or years in the series. Index numbers make possible the comparison of price changes for specified groups of commodities even though the price within the group is quoted for different units of measure. For example, price changes for feed grains which are quoted in dollars per bushel may be compared with price changes in meat animals which are quoted in dollars per hundred-weight. Also, prices of some products are much more important than others in a particular group. In the case of the poultry and egg group for example, the index combines prices of chickens, turkeys, and eggs according to the importance of each.

The index is of the aggregative type, in which prices for a specific period are weighted by quantities sold in the weight base period.

Method of Constructing the All-Product Farm Price Index

1. Commodity Coverage

A total of 78 crop and livestock commodities are included in the Oregon all-product farm price index consisting of 13 items in the livestock and livestock products index and 65 items in the crop index. Livestock and livestock products are grouped into 4 sub-indexes, and

^{1/} "Agricultural Economic Research," April 1950, and "Agricultural Prices," Supplement #1 to January 1950 issue and Supplement to February 1950 issue, Bureau of Agricultural Economics, U. S. Department of Agriculture, Washington, D. C.

crops into 8 sub-indexes as follows:

a. Livestock

- | | |
|-------------------|---------------------|
| 1. Meat Animals | 3. Poultry and Eggs |
| 2. Dairy Products | 4. Wool and mohair |

b. Crops

- | | |
|--------------------------------|--|
| 1. Food Grain - Wheat | 5. Commercial Vegetables
for fresh market |
| 2. Feed grains and hay | 6. Commercial Vegetables
for processing |
| 3. Potatoes | 7. Seed crops |
| 4. Fruit, nuts, and
Berries | 8. Other crops |

2. Weights - (See table 1)

The United States Index before the 1950 revision had one weight period. That is, prices from 1910 to 1950 were weighted by the 1935-39 average quantity sold. A constant weight period does not give consideration to the shifts in the importance of commodities over time. As the period covered by the index lengthens, the illogicalness of using a single set of weights over the whole period increases. It was decided to construct indexes over intervals, using in each interval an applicable set of weights. In the present index there are two such intervals--January 1910 to April 1934 using 1924-29 weights, and May 1934 to date using 1937-41 weights.

1910-34 Period

From January 1910 to May 1934, prices were multiplied by the average quantities marketed during 1924-29. The aggregates were summed for the subgroups and expressed with 1924-29 = 100. The subgroups were weighted into the group totals by applying percentages representing the proportion of total cash receipts from the sale of commodities in the particular group during the 1924-29 period. The resulting index is then converted to a 1910-14 = 100 base by dividing by the 5-year, 1910-14, average annual index for each subgroup or for each group.

1934 to Date Period

From May 1934 to the present time, prices are multiplied by the average quantities sold during the 1937-41 period. The aggregates are summed for the various subgroups then divided by

comparable aggregates in the 1937-41 base period to give index numbers on a 1937-41 basis. Five year (1937-41) average cash income percentage weights are used for combining the commodity group indexes into the all crop, all livestock, and all farm product indexes.

Linking Two Periods

The indexes from May 1934 forward are then linked to the index on a 1910-14 = 100 basis using May 1934 as the link point. This is accomplished by computing the May 1934 index on both the 1924-29 = 100 base and the 1937-41 = 100 base and deriving a conversion factor. (This factor multiplied by the May 1934 index on the 1937-41 = 100 base equals the May 1934 index on a 1910-14 = 100 base computed using the 1924-29 weights.) Each monthly index in the group concerned computed on the 1937-41 = 100 base, when multiplied by this factor K for the period May 1934 to date, will be converted to the 1910-14 = 100 base period and linked to the index from January 1910 to April 1934.

Table 1. OREGON PRICES RECEIVED INDEX
BASE WEIGHTS FOR GROUPS AND SUBGROUPS

	1924-29		1937-41

Comm'l Veg. for Processing			4.1	
Seed Crops			10.4	
Other Crops	6.5		9.3	

3. Converting to a Different Base

The index numbers presented in this series may be converted to a base other than 1910-14 = 100 simply by dividing each index number by the desired base. For example, if it is desired to express the index numbers for a given series as a percentage of the 1947-51 average, first compute the average index for 1947-51 by averaging the monthly indexes for the 5-years, 1947 to 1951. Then divide each of the monthly

indexes for the particular group by the 1947-51 average index for this group. This will express the index on a 1947-51 = 100 base.

4. Introducing Items Into the Index

The Department of Agriculture has collected data on prices received by farmers since 1909. In Oregon monthly price estimates are available for important commodities since January 1909. However, since that time monthly and season price estimates of many farm products have been added. Generally, commodities have been added to the index in the year that the data became available. However, from 1909 to 1934 no crops were added unless the price information was available in the period 1924 to 1929 which was the weight base period. Commodities for which estimates were initiated after 1924 were not included until May 1934, when the new weight base, 1937-41, was used. Truck crops and seed crops were introduced as new commodity groups in 1920. To convert the truck crop or seed crop group to a 1910-14 = 100 base, the "all crops" conversion factor was used.

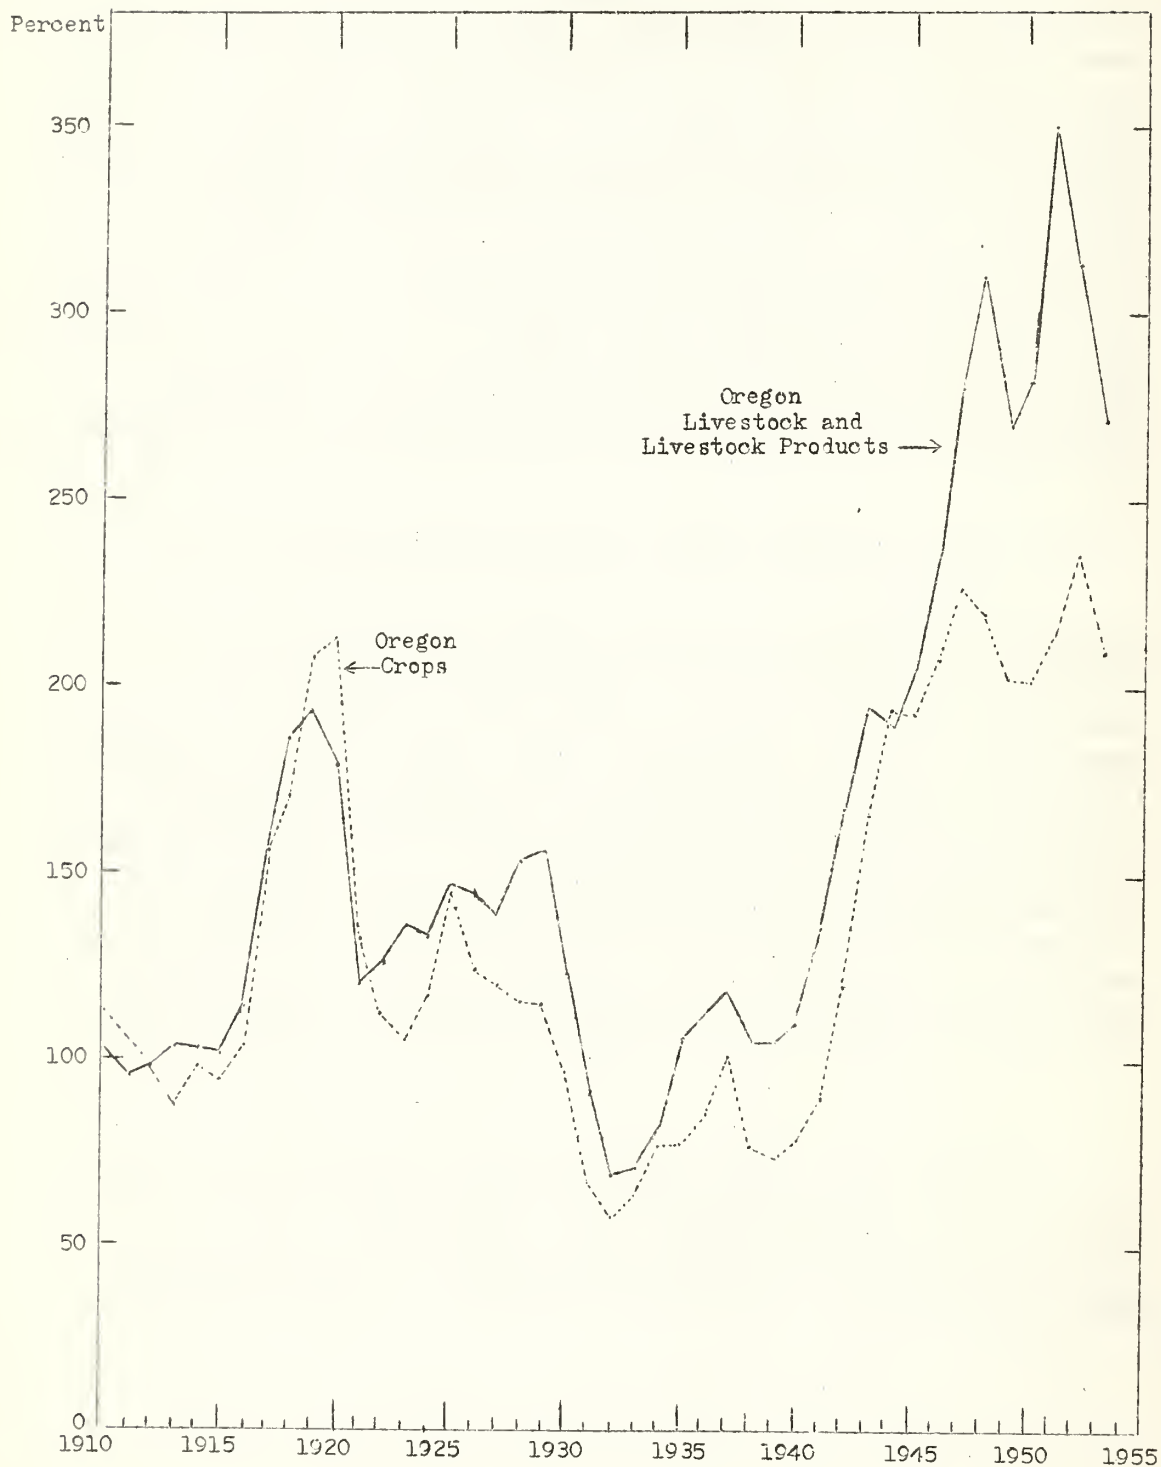

5. Season Average Prices for Incomplete Monthly Prices

Prices of some commodities are collected annually instead of monthly. For such commodities, the season average prices have been used for each of the 12 months in the marketing season. For example, the 1951 season average price of peas for processing has been used from June 1951 to May 1952. Thus, subgroups which are composed predominantly of season average price commodities tend to change level only once a year at the time when the new season average prices are put in the index. When constructing the index it was necessary to use season average prices for commercial vegetables for fresh market; however, beginning with 1952, monthly average prices were collected. Thus season average prices were used only during the months that the crop was not being marketed.

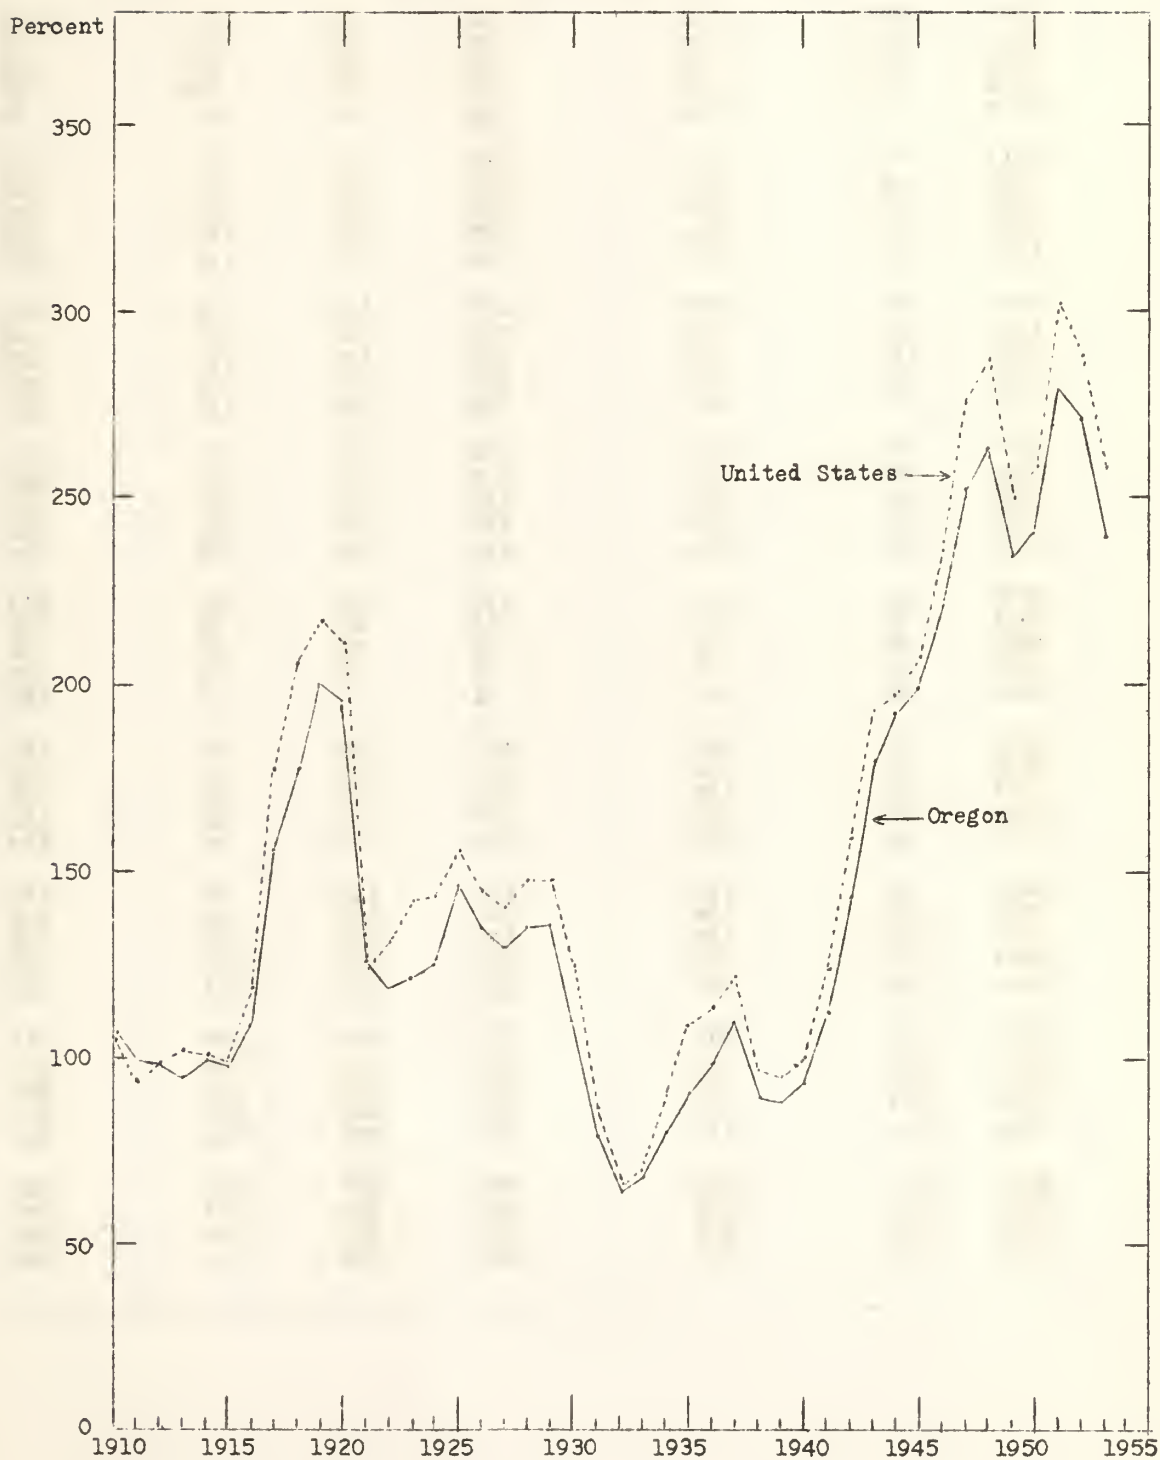

6. Revision Program

In some cases, supplementary data on a seasonal basis necessitates revisions in monthly or annual price estimates. Revised index numbers will be published once a year in the March Oregon Agricultural Prices at which time final prices will be substituted for preliminary data.

Seasonal Factors for Adjusting Egg, Milk Fat in Cream, and
Wholesale Milk Prices

Seasonal factors for adjusting the monthly prices of eggs, milk fat in cream, and whole-sale milk to an annual basis are presented below. The seasonal factors for milk fat in cream and for milk are based on the average variation for the 38 years, 1910-47, and for eggs on the average variation for the five years, 1948-52. To adjust a commodity price for seasonal variation in any given month, the actual price is divided by the individual commodity factor of seasonality for the corresponding month.

Factors Currently Used in Adjusting Prices for Eggs,
Milk Fat in Cream, and Wholesale Milk for Seasonal Variation
Oregon

Month	: Eggs	: Milk Fat in Cream	: Wholesale Milk 1/
January	95	103	110
February	86	102	105
March	84	101	98

1/ Peppermint, hops, sugar beets, flaxseed and dry field peas.

PART II

PRICES RECEIVED BY OREGON FARMERS

MONTHLY, 1909-1953

These prices represent composite averages of prices received for all classes or sizes and grades from all methods of sale. They most nearly reflect returns to growers from sales made at the first delivery point and in the condition in which the products are first sold. The average price takes into consideration many different methods of sale. For example, the average price for a particular fruit crop is a composite average of the price of the fruit packed for fresh consumption in the FOB position, the price of the fruit sold locally in loose pack, and the price of bulk fruit sold to processors, each price weighted by the best current estimate of quantity sold in each position. The most important use of this average price is to provide current estimates for computing farm income and for computing index numbers. It should not be used to indicate what a particular producer received at a particular market for a particular grade or class of a commodity. The daily price quotations, published by the Market News Service of the Department of Agriculture, more nearly serve this purpose.
